In a lot of designs, the geotechnical and the structural engineer fail to work in a collaborative manner, and ultimately, the intricacies in soil foundation-structural-interaction are not captured and/or explored. An example of the current application of site-specific geotechnical earthquake engineering is illustrated in Figure 1.

“While many cases of soil effects had been observed and reported for many years, it was not until a series of catastrophic failures, involving landslides at Anchorage, Valdez and Seward in the 1964 Alaska earthquake, and extensive liquefaction in Niigata, Japan, during the earthquake in 1964, caused geotechnical engineers to become far more aware of, and eventually engaged in understanding, these phenomena.” (I. M. Idriss, 2002)
