although deep learning models have achieved great progress in vision speech language planning control and many other areas there still exists a large performance gap between deep learning models and the human cognitive system many researchers argue that one of the major reasons accounting for the performance gap is that deep learning models and the human cognitive system process visual information in

very different ways to mimic the performance gap since 2014 there has been a trend to model various cognitive mechanisms from cognitive neuroscience e.g attention memory reasoning and decision based on deep learning models this book unifies these new kinds of deep learning models and calls them deep cognitive networks which model various human cognitive mechanisms based on deep learning models as a result various cognitive functions are implemented e.g selective extraction knowledge reuse and problem solving for more effective information processing this book first summarizes existing evidence of human cognitive mechanism modeling from cognitive psychology and proposes a general framework of deep cognitive networks that jointly considers multiple cognitive mechanisms then it analyzes related works and focuses

primarily but not exclusively on the taxonomy of four key cognitive mechanisms i.e attention memory reasoning and decision surrounding deep cognitive networks finally this book studies two representative cases of applying deep cognitive networks to the task of image text matching and discusses important future directions
